

Low-profile terrace support system

Function:

Terrace support system ideal for laying all kinds of coverings, especially stone slabs and timber grate constructions. The height can be adjusted using levelling elements to compensate for unevenness of the substrate and gradients. The KALA pedestal forms a sliding bearing system with the pressure plate, which is available as an accessory for direct placement on the waterproofing. In public areas with high footfall, such as cafeterias and visitor terraces, additional protective mats must be placed underneath.

Variants:

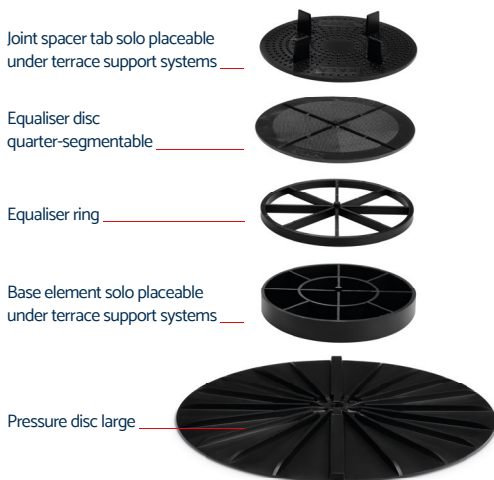

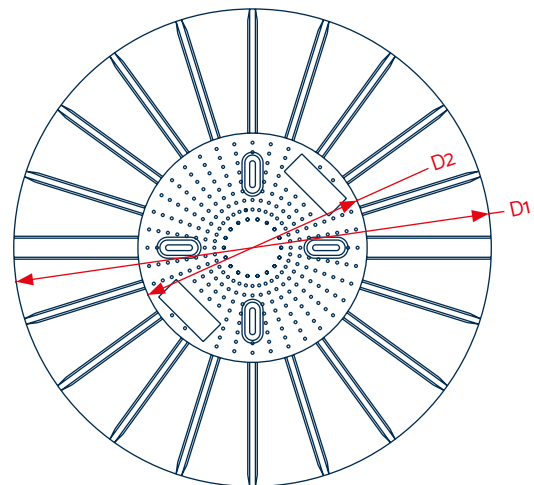

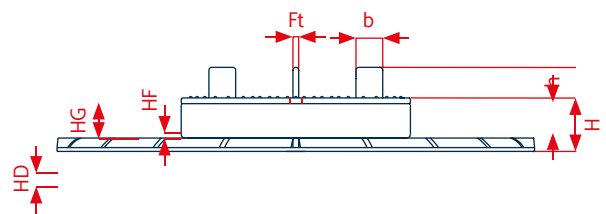

- Joint spacer tabs for joint widths 3 mm¹, optionally various joint widths
- Joint spacer tabs detachable for laying in bond or at the edge

Packaging units:

- Delivery in box, PU 100 pieces
- Terrace support system (joint spacer tab and base element) or joint spacer tab solo, base element solo

Accessories:

- ProSilent disc
- Equaliser disc quarter-segmentable
- Equaliser ring
- Pressure disc
